principal components factor analysis pdf

Principal component analysis (PCA) is a statistical procedure that uses an orthogonal transformation to convert a set of observations of possibly correlated variables (entities each of which takes on various numerical values) into a set of values of linearly uncorrelated variables called principal components.

Principal component analysis - Wikipedia

1 Paper 203-30 Principal Component Analysis vs. Exploratory Factor Analysis Diana D. Suhr, Ph.D. University of Northern Colorado Abstract Principal Component Analysis (PCA) and Exploratory Factor Analysis (EFA) are both variable reduction techniques

Principal Component Analysis vs. Exploratory Factor - SAS

Types of factor analysis. Exploratory factor analysis (EFA) is used to identify complex interrelationships among items and group items that are part of unified concepts. The researcher makes no a priori assumptions about relationships among factors.

Factor analysis - Wikipedia

Principal component analysis is a statistical technique that is used to analyze the interrelationships among a large number of variables and to explain these variables in terms of a smaller number of variables, called principal components, with a minimum loss of information.

Principal Component Analysis (PCA) | Real Statistics Using

Principal Component Analysis 3 Because it is a variable reduction procedure, principal component analysis is similar in many respects to exploratory factor analysis.

Principal component analysis - University of Texas at Dallas

Data standardization. In principal component analysis, variables are often scaled (i.e. standardized). This is particularly recommended when variables are measured in different scales (e.g: kilograms, kilometers, centimeters, $\hat{\epsilon}$!); otherwise, the PCA outputs obtained will be severely affected.
